Data Availability Principles and Practice

KEYWORD: Editorial

Science requires evidence. Making data available lets other scientists confirm results, uncover errors, or find new insights. Moreover, gathering data can be expensive and time consuming. Since the same data can be used for a range of purposes, making data available can be an efficient use of limited research resources. Doing so can also improve traceability and, thus, accountability, when it comes to research findings.

These reasons and more lie behind recent efforts to promote data availability. The American Meteorological Society (AMS) recently updated its data policy guidelines (<https://www.ametsoc.org/index.cfm/ams/publications/ethical-guidelines-and-ams-policies/data-policy-and-guidelines/>) to require, among other things, that papers in its journals include a Data Availability Statement. Data do not need to be “open.” Authors simply need to explain how to find and use the data or why, in some limited circumstances, the data are not available.

Papers that appear in *Journal of the Atmospheric Sciences* often involve very large datasets, not all of which are publicly available. The Data Availability Statement should make clear what has been archived and what steps have been taken to provide information about the data that could not be kept. We do not wish to impose a “one-size-fits-all” requirement, which may serve as a barrier to authors. In fact, one of our goals in this endeavor is to ensure that no authors are excluded from publishing in our journals due to resource limitations, institutional restrictions on sharing data, or legal constraints.

The Data Availability Statement need not be long, and the statement does not count toward the word count limit. If data are for some reason unavailable, authors must make a good-faith effort to explain the circumstances. See the AMS example statements (<https://www.ametsoc.org/index.cfm/ams/publications/authors/journal-and-bams-authors/formatting-and-manuscript-components/data-availability-statement-examples/>) to gain a sense of expectations. Our editors are willing to work with authors to accommodate any difficulties or unique situations.

Thoughtful data availability requirements such as AMS’s benefit both the scientific community and society. Consistent policies and practices can help reduce misunderstanding and divergent interpretations. As editors, we do not wish or intend that the data availability requirement becomes a barrier to publication, whether because of the sensitivity of the data or due to limited institutional resources. At the same time, the exceptions to making data available should not be used by researchers as a way to evade their responsibilities. We welcome contributors to and readers of *JAS* to read the AMS data policy and to contact us with any questions or concerns.
