

p. 50. 3rd line, "southwesterly" and "northwesterly" should be "northeasterly" and "southeasterly." 7th line, "westerly" should be "easterly." On same page, "Prevailing Westerlies" is misplaced to "Anti-Trades."

p. 57. "In meteorology the plane of contact (between air layers) is commonly known as a *ceiling* or *lid*"—only when the cool air is below, and the warm air above.

p. 76. The cloud picture is upside down. pp. 78 and 94, legends to cloud pictures are erroneous.

pp. 201, 254. "kilobar" should be "bar."

p. 173 and elsewhere in the interesting chapter on "Forecasting the Weather: weather folklore," the weather proverbs and the indications presented by the author are stated so positively that, if taken literally, they are likely to be disappointing in use.

In drawing attention to these errors and mentioning the presence of others, I merely wish to add to the usefulness of this book. Simply the valuable part on instruments and their uses and the handy reference tables are enough to earn for the book a place wherever meteorological instruction is given.

Charles F. Brooks.

THE RESEARCH INFORMATION SERVICE OF THE NATIONAL RESEARCH COUNCIL.

The Research Information Service is a clearing-house for scientific information. Its aim is to furnish all sorts of useful information about scientific methods and results, and their practical applications to engineering industry and education.

The country is full of good sources of information. The difficulty is, few persons know where and how to get the information they need. This is the opportunity of the Research Information Service, which either knows or will make every effort to find out where and how your needs can be met. Instead of merely telling you where to find the information, the Service will attempt, when this seems desirable, to assemble and deliver it to you.

No charge is made for replies to inquiries which do not necessitate a special search for information. Requests for data which can be secured only by expending considerable time are acknowledged with an estimate of the necessary cost of assembling what is desired. The Service then awaits instructions.

The Service desires and expects to coöperate effectively with the many other informational sources (libraries, laboratories, research institutions and individual specialists). It believes in utilization rather than duplication of labor.
