

with pressure below 29.70. During the 26th the storm apparently divided, one part passing to Manitoba and the other to South Dakota. The morning of the 27th a trough of low pressure extended from Lake Superior to Colorado with 2 cyclonic centers, one north of Lake Superior and the other over Nebraska. On this date thunderstorms occurred in Nebraska, heavy rains were noted in Wisconsin and Ohio, and high westerly winds prevailed over the Lake region. By the night of the 27th the cyclonic area over Nebraska had been forced southward by an area of high pressure from the northwest and it apparently disappeared by an increase of pressure over western Texas and New Mexico. The storm central north of Lake Superior advanced to the region northeast of Georgian Bay by the night of the 28th, attended by thunderstorms in New York and the Ohio Valley, and heavy rain at points in the upper lake region. The storm remained

nearly stationary over the Saint Lawrence Valley during the 29th, with rain from the upper Mississippi valley over the middle Atlantic and New England states, and thunderstorms in New York state. By the morning of the 30th the center had disappeared over the Gulf of Saint Lawrence, rain continued in the middle Atlantic and New England states, and thunderstorms were reported in northern Virginia.

XI.—Appeared over Alberta the night of the 28th, with pressure 29.70, and during the 29th advanced eastward north of Montana, with pressure below 29.60, and rain and thunderstorms in the middle Rocky Mountain region. During the 30th the storm-center advanced eastward over Manitoba, without evidence of marked strength, and during the 31st passed to the region east of Lake Superior, with rain in the Atlantic coast states, and thunderstorms at points in the middle Atlantic coast states.

NORTH ATLANTIC STORMS FOR JULY, 1892 (pressure in inches and millimeters; wind-force by Beaufort scale).

The paths of storms that appeared over the west part of the north Atlantic Ocean during July, 1892, are shown on Chart I. These paths have been determined from reports of observations by shipmasters received through the co-operation of the Hydrographic Office, Navy Department, and the "New York Herald Weather Service."

In July there is usually an increase of pressure over the north Atlantic Ocean, except off the middle Atlantic and New England coasts and over eastern and extreme northern parts of the ocean. The increase of pressure is small, less than .05 inch, while from the British Isles northward the decrease is .05 to .10 inch.

The storms of July advance eastward over the north Atlantic at an average velocity of 19 statute miles per hour, and an average of 1.8 storm traverses the ocean from coast to coast. The principal track of July storms is traced from Newfoundland to a point west of Scotland, where it divides, one branch passing northeastward along the coast of Norway, one eastward over the North and Baltic seas, and one southeastward over Great Britain and France.

The storms of the current month were of small intensity, and no storms of tropical origin appeared within the region of observation. Four of the storms traced apparently advanced from the American to the European coasts. On the 3d a cyclonic depression moved eastward from the Labrador coast and reached mid-ocean on the 4th, with central pressure about 29.40 (747), and westerly gales of force 7 to 10. By the 5th this storm had advanced north of the British Isles, with pressure about 29.50 (749). During the 4th a storm of marked strength, low area I, moved east-northeast over the Gulf of Saint Lawrence, with pressure below 29.50 (749), and on the 5th was central north of the Banks of Newfoundland, with west to north gales of force 9 in the trans-Atlantic tracks between the 40th and 50th meridians. Moving north of east this storm passed north of the British Isles during the 8th, its passage being attended by strong northwest gales between the 20th and 30th meridians on the 6th.

On the 8th a storm apparently moved eastward from Labrador and reached mid-ocean on the 9th, with pressure about 29.50 (749), and westerly gales of force 9 to 10 between the 30th and 40th meridians. During the next 24 hours this storm increased in energy, and pressure below 29.40 (747) and northwest gales of force 10 were noted between the 20th and 30th meridians. During the 11th and 12th the storm-center remained nearly stationary west of Ireland, with northwest gales of force 9 to 10 east of the 20th meridian. By the 13th the center of disturbance had passed southeastward to the Bay of Biscay, and by the 14th had moved eastward over the continent of Europe.

On the 12th a storm appeared central north of the Banks of Newfoundland, and passed thence to mid-ocean, where pressure falling to about 29.70 and fresh gales were reported for the 13th and 14th. By the 16th the center of disturbance had

advanced south of Ireland, after which it disappeared to the eastward. During the 14th low area IV moved eastward over northern Newfoundland and occupied the region north of the Grand Banks on the 15th, after which the center apparently recurved westward and united with low area V. Low area V crossed the Gulf of Saint Lawrence and northern Newfoundland on the 17th, and passed thence rapidly northeastward beyond the region of observation. Low area VII moved eastward north of the Saint Lawrence River during the 22d, and the morning of the 23d was central over or near Labrador. This storm apparently remained stationary north of Newfoundland and the Grand Banks until the 27th, when it was joined by low area IX. During the next three days the pressure continued low over the western part of the ocean, with fresh south to west gales west of the 40th meridian. The month closed with high pressure and generally fine weather from coast to coast.

OCEAN ICE IN JULY.

The following table shows the southern and eastern limits of the region within which icebergs or field ice were reported for July during the last 10 years:

Southern limit.			Eastern limit.		
Month.	Lat. N.	Long. W.	Month.	Lat. N.	Long. W.
July, 1883.....	42 42	49 57	July, 1883.....	46 47	45 44
July, 1884.....	46 24	50 02	July, 1884.....	48 36	46 28
July, 1885.....	42 14	48 30	July, 1885.....	48 00	44 00
July, 1886.....	42 59	49 18	July, 1886*.....	45 52	34 30
July, 1887.....	43 30	50 05	July, 1887.....	52 04	41 16
July, 1888.....	46 39	54 00	July, 1888.....	47 40	50 10

Mean.....	43 44	49 25	Mean.....	48 00	44 00

*An iceberg and field ice. †On the 10th a small piece of ice was reported in N. 48° 33', W. 24° 11'.

The limits of the region within which icebergs or field ice were reported for July, 1892, are shown on Chart I by ruled shading.

The southernmost ice reported, an iceberg observed on the 28th in the position given, was about 1° south of the average southern limit, and the easternmost ice reported, a large iceberg noted on the 20th in the position given in the table, was nearly 1° west of the average eastern limit of Arctic ice for July. The ice of the current month was noted most frequently in and east of the Straits of Belle Isle and off the southeast coast of Newfoundland.

OCEAN FOG IN JULY.

The limits of fog belts west of the 45th meridian, as reported by shipmasters, are shown on Chart I by dotted shading.

More than the usual amount of fog was reported. Near the Banks of Newfoundland fog was reported on 26 dates; between the 55th and 65th meridians on 18 dates; and west of the 65th meridian on 17 dates. Compared with the corresponding month of the last 4 years the dates of occurrence of fog east of the 55th meridian numbered 3 greater than

the average; between the 55th and 65th meridians 4 greater than the average; and west of the 65th meridian 8 greater than the average. The fog noted by shipmasters and that reported by observers of the Weather Bureau on the New England and middle Atlantic coasts generally attended the advance or passage of general storms.

TEMPERATURE OF THE AIR (expressed in degrees, Fahrenheit).

The distribution of mean temperature over the United States and Canada for July, 1892, is exhibited on Chart II by dotted isotherms. In the table of miscellaneous meteorological data the monthly mean temperature and the departure from the normal are given for regular stations of the Weather Bureau. The figures opposite the names of the geographical districts in the columns for mean temperature and departure from the normal show, respectively, the average for the several districts. The normal for any district may be found by adding the departure to the current mean when the temperature is below the normal and subtracting when above. The monthly mean temperature for regular stations of the Weather Bureau represents the mean of the maximum and minimum temperatures.

The mean temperature was highest in the Gila and lower Colorado valleys, where it was above 95, and the mean readings were above 85 in adjoining parts of Arizona and southern California, and in the lower Rio Grande valley. Over the Florida Peninsula, along the South Carolina, Georgia, and Gulf coasts, in Louisiana, Texas, and Indian and Oklahoma territories, over the southwestern plateau region, and in southeastern California the mean values were above 80. The mean temperature was lowest along the immediate Pacific coast north of San Francisco, Cal., where it was below 55, and it was below 60 in Calgary, in the mountains of central Colorado, in the lower Saint Lawrence valley, and at Yarmouth, N. S.

DEVIATIONS FROM NORMAL TEMPERATURE.

The following table shows for certain stations, as reported by voluntary observers, (1) the normal temperature for July for a series of years; (2) the length of record during which the observations have been taken, and from which the normal has been computed; (3) the mean temperature for July, 1892; (4) the departure of the current month from the normal; (5) and the extreme monthly mean for July during the period of observation and the years of occurrence:

State and station.	(1) Normal for the month of July.	(2) Length of record.	(3) Mean for July, 1892.	(4) Departure from normal.	(5) Extreme monthly mean for July.

DEPARTURES FROM NORMAL TEMPERATURE.

The mean temperature was below the normal, except along the northern border of the country east of the 110th meridian, in New England, eastern New York, and eastern Pennsylvania, and over east parts of the middle and southern plateau regions. The most marked departure below the normal temperature was noted in North Carolina, South Carolina, at Vicksburg, Miss., and in the valley of the Columbia River, where it was more than 3, and the mean temperature was 2 to 3 lower than usual generally east of the Mississippi and south of the Ohio rivers, in Washington and Oregon, and along the
