was a general deficiency, ranging from 0.2 to 0.22 over central and east Texas, and from 0.26 to 1.40 over north Texas, with the greatest in the vicinity of Paris. The greatest monthly precipitation was 7.23 at Stafford.

Ohio.—The mean temperature was 72.0°, or about 1.0° below normal; the highest was 111°, at George; the 11th, and the lowest, 35°, at Soldier Summit on the 1st. The average precipitation was 1.8; the greatest monthly amount, 3.85, occurred at Koosharem, and the least, 0.16, at Cisco.

Virginia.—The mean temperature was 76.3°, or about normal; the highest was 102°, at Bonair on the 28th, and the lowest, 49°, at Blacksburg on the 8th. The average precipitation was 6.96, or 3.38 above normal; the greatest monthly amount, 11.23, occurred at Spottsville, and the least, 3.35, at Hopewell.

Washington.—The mean temperature was 68.2°, or 3.3° above normal; the highest was 112°, at Bridgeport, Fort Simcoe, and Connell, and the lowest, 37°, at Blaine on the 26th, and Hunters on the 23rd. The average precipitation was 9.06, or 0.50 below normal; the greatest monthly amount, 6.00, occurred at Rosalila; no rain fell at more than half of the stations. The chief characteristic of the month of July, 1896, was the general absence of precipitation. Seldom, if ever, has there been such a protracted drought in the eastern section, and in the western section there has been but one like it since the settlement of the country; that was in 1885. This year, at 50 per cent of the stations no rain at all fell, or only the slightest trace. The drought begun in June, there having been heavy rainfall after the 8th. In the eastern section of the state there were a few scattered thunderstorms during the month of July.

West Virginia.—The mean temperature was 73.2°, or about 2.0° below normal; the highest was 97°, at Hewett on the 29th, and the lowest, 45°, at Beckly on the 19th, and Bloomery on the 18th. The average rainfall was 9.07, or nearly 5.0 above normal; the greatest monthly amounts were 15.70, at Phillipi; 15.60, at Beverly; 15.15, at Weston, and 15.08, at New Martinsville. The least amount was 2.91 at Green Sulphur Springs. Exceedingly heavy rains occurred in the northern-central and Ohio Valley counties, and in other sections the rainfall was considerably above the normal. The rivers of the northern part of the State were flooded to a height greater than ever before known at this period of the year, and very great damage was done to crops and property along their courses and on lowlands. In many localities the crops were totally destroyed, and in all sections were more or less injured by the wet weather. These storms were generally electrical, and in some exhibited tornado tendencies. The observer at Beverly reports the occurrence of the 19th of a simulation that ever before had been seen at that valley, and at Glenville, on the 28th, a storm occurred which was said to have been the severest ever known in that locality, and which exhibited the character of a tornado. The heaviest of these storms occurred from the 15th to 16th, the 21st to 26th, and on the 28th and 30th.

Wisconsin.—The mean temperature was 69.8°, or less than 1.0° below normal; the highest was 100°, at Madison on the 8th and Oceola on the 10th; the lowest, 80°, occurred at Eau Claire on the 26th. The average precipitation was 3.15, or slightly less than normal; the greatest monthly amount, 8.90, occurred at Delevan, and the least, 0.17, at Pepin.

Wyoming.—The mean temperature was 68.0°, or about normal; the highest was 114°, at Laramie; the lowest 58°, at Wheatland on the 14th. The average precipitation was 3.94, being decidedly above normal; the greatest monthly amount, 6.35, occurred at Cheyenne, and the least, 0.22, at Wheatland.

SPECIAL CONTRIBUTIONS.

KITTS IN MONTANA.

By Mr. A. B. Cox.

From recent letters received from Mr. R. M. Crawford, director of the Montana section of the Climate and Crop Service, and from Mr. A. B. Cox, voluntary observer at Kipp, Montana (N. 45° 45', W. 112° 45', elevation about 4,000 feet), we take the following notes, and hope that others may be led to pursue similar studies with the same enthusiasm. Mr. Cox says:

I herewith transmit an account of a little experiment tried recently, employing a cellular kite of the dimensions described in the November, 1895, Weather Review for the purpose, and my maximum thermometer.

A phase of our climate at this station is the frequent veering of the wind from westerly points to north or northeast, accompanied by an extremely rapid fall of temperature, and usually more or less precipitation.

I have often thought that these cold waves did not reach very high up, and that at no great height above them the warm southwest wind still prevailed. For several days prior to July 29, my maximum had been climbing up into the nineties too frequently for comfort. The air was dense with smoke, when the wind suddenly veered to the northeast, blowing steadily at about 15 or 20 miles an hour, and pretty thoroughly clearing the atmosphere of smoke. The temperature fell 51° in the next twenty-four hours, and on the 21st the clouds were dragging on the ground, and precipitating both rain and snow. At 11.50 a.m., on that date, my minimum thermometer registered 32°, but only for a few minutes, as it rose to 60° in a few minutes, while from another experiment tried at the same time, the difference in temperature at each trial was the same stated. The latter current of air, which exhibited the character of a tornado. I noticed that the kite above the fog and clouds was pulling nearly northeast, instead of southwest, as at first. Upon pulling it in, during the same period, my minimum indicated 92°, and my maximum 111°. I was overjoyed to discover that the register stood at 77°, while at the point where I stood it remained at 39°. Being anxious to make a third trial with another kite, I sent the instrument up again, and obtained a similar result at about the same altitude, the kite going through the same movements as at first; but whether my observation is of any value aside from the personal satisfaction derived, is a question.

I anticipate some interesting experiments this coming winter in this direction, if possible, as has been oftentimes, at what elevation the warm winds were locally termed "chinoooks" blow, at times when their influence is felt many miles east of this point, while remaining intensely cold here.

In response to a request for further data as to the protection of his thermometer and other matters, Mr. Cox writes:

I employed a strong pasteboard tube 12 inches in length, and 1 inch in diameter for the purpose. In this I sewed my maximum thermometer securely with strong jack thread, and packed fine cotton around each end for the better protection of the tube. Directly over the tube I cut a slit 4 by 8 inches, so that the scale could be readily seen without which it is impossible. Four feet from the belly I secured the tube to the twine with fine wire. The wind was blowing a good south breeze at the time, probably 20 miles an hour, and from the time the kite was let go until pulled in 25 and 35 minutes, respectively, elapsed, and the difference was not at about the same altitude, the kite going through the same movements as at first; but whether my observation is of any value aside from the personal satisfaction derived, is a question.

I am satisfied that the kite passed through the clouds into bright sunshine. I secured a strip of sensitized paper between two thin pieces of mica, and sent it up attached to the kite, and exposed a similar piece to the light on the ground, in a like manner to protect the paper from dampness. While the paper at my feet remained unchanged in color to any extent the piece sent up was changed to a bronze black.

SUNSHINE AT THE SOUTHERN CALIFORNIA AGRICULTURAL EXPERIMENT FARM, NEAR POMONA, CAL.

By Mr. A. J. Henry.

The percentages of sunshine for the six months, January to June, 1896, at the Southern California Agricultural Experiment Farm are given in the table below. The data are published as compiled in the Records Division of the Weather Bureau, from the original photographic sheets made under the direction of Mr. J. W. Mills, foreman of the experiment.
