(Manuscript received 12 September 2016, in final form 13 September 2016)

---

In section 3b of [Menelaou et al. \(2016\)](#), there is a misstatement regarding the definition of the radius  $r_c$  that may lead to some confusion. The correct definition of  $r_c$  is the radius at which  $d\bar{\zeta}/dr = 0$ . In other words,  $r_c$  is located where the basic-state relative vorticity  $\bar{\zeta}$  is peaked. The first paragraph of section 4a contains a related misstatement that the radial derivative of basic-state angular velocity  $\bar{\Omega}$  is negative for  $r > r_c$ . With the correct definition of  $r_c$ , a more accurate claim is that  $d\bar{\Omega}/dr < 0$  for radii appreciably beyond the edge of the vortex core.
