

## CLIMATOLOGICAL DATA FOR AUGUST, 1913.

## DISTRICT NO. 10, GREAT BASIN.

ALFRED H. THIESSEN, District Editor.

## GENERAL SUMMARY.

The dominating feature of the weather for August in the Great Basin was the large number of local storms, causing delayed train service in Nevada, and landslides and floods, which were attended by damage in both Utah and Nevada. The temperature for the district averaged slightly below normal, but nevertheless August was the warmest month of the summer season. Weather conditions as a rule were said to be favorable to crop growth and for all farming operations; but considerable local damage was sustained by floods carrying large amounts of gravel and sand over cultivated fields. Irrigation water in Utah was reported as sufficient for all needs.

The average number of clear days for the district was 15; partly cloudy days, 11; cloudy days, 5; and rainy days, 5.

## TEMPERATURE.

The mean temperature for the district averaged 68.9°, which is 0.4° below normal, and varied from 53.2° at Park City, Utah, to 83.4° at Jean, Nev. The warmest weather occurred in the more level portions of the Utah area and in the central, western, and southern portions of the Nevada area; the Wyoming, Oregon, and mountainous portion of the Utah areas were the coolest. There were wide departures from the normal temperatures at the various stations. The greatest deficiency was 9.2° at Beowawe, Nev., whose mean for the month was 65.9°; and the greatest excess was 5.0° at McGill, Nev., whose mean was 69.6°.

The month began with nearly normal temperatures in all parts of the district, the afternoon temperatures being quite high, but the night temperatures falling to the forties, brought the average down to normal. The coolest weather of the month occurred from the 13th to the 20th, and freezing temperatures were recorded at many stations, most of which were at the higher elevations. The warmest portion of the month was from the 20th to the 22d, but a few stations reported their highest temperatures on the 28th or 29th.

The highest temperatures that occurred in the various areas of the several states in this district were as follows: 95° on the 28th at Cokeville, Wyo.; 102° on the 22d at Grace, Idaho; 102° on the 22d at Low, Utah; 106° on the 5th and 21st at Jean, Nev.; 94° on the 24th at Cliff and Silver Lake, Oreg.; and 86° on the 6th at Bridgeport, Cal. The lowest were 31° on the 16th at Cokeville, Wyo.; 40° on the 17th at Weston, and on the 15th, 18th, and 19th at Grace, both in Idaho; 26° on the 13th and 17th at Park City, Utah; 25° on the 26th and 30th at Geysers, Nev.; 20° on the 18th at Cliff, Oreg.; and 30° on the 17th at Bridgeport, Cal.

## PRECIPITATION.

The average precipitation for the district was 0.99 inch, or 0.18 inch above normal. The smaller amounts occurred in the Idaho and Wyoming areas, and the larger in the eastern portion of the Utah and western portion of the Nevada areas. In the Nevada area the rainfall averaged 0.31 inch above normal, and twice that recorded in August last year. As the precipitation was mostly in the form of local showers, adjacent stations reported widely different amounts and on different dates. Also while certain stations reported amounts much in excess of their normals, it is quite probable that the amounts that fell on some of the elevated watersheds where no stations are maintained, were very heavy and exceeded their normals by a much greater amount than did the recorded amounts at the less elevated stations where records are kept. The evidence of this is the great number of cloudbursts reported.

The greatest local monthly amount was 4.49 inches at Park City, Utah. At Low, Utah, no rain fell, and at a few stations traces only were reported. The largest 24-hour amount was 1.70 inches at Shields Ranch, Nev., on the 29th; many other stations reported over an inch in 24 hours.

Excepting a period from the 13th to the 20th, generally showery conditions prevailed throughout the month over the greater portion of the district. The greater amount of rain for the month fell during the last decade.

## LOCAL STORMS.

The observer at Moroni, Utah, Mr. B. F. Eliason, writes:

One of the worst storms ever known at this place occurred on the 4th; its area was 1½ miles wide and from 3 to 5 miles long. The rain gage caught 1.54 inches in 1 hour and 20 minutes. The storm was accompanied by high winds and by hail measuring one-half inch in diameter. I was in the center of the storm and feel convinced that 4.50 inches fell in 3 hours and 15 minutes. The rain gage was at the edge of the storm which accounts for the smaller amount recorded. Leaves were beaten from the garden truck, fruit was severely bruised, barley that was overripe was shattered from the stalks, corn was torn in shreds, and land lying fallow was badly washed.

On August 9 it was reported that every canyon west of Richfield had its flood. It was estimated that 1,000 cubic feet of water per second passed through the culvert and over the canal bridge from the Flat Canyon flood. To the north and south of Richfield considerable damage was done to crops, and it was reported that the second cutting of alfalfa in all parts of the country around Richfield was greatly damaged.

The observer at Manti, Mr. J. M. Anderson, reported that on August 19 a flood came down from the foothills

and swept the north side of the town of Mayfield, carrying away some grain and hay that lay in its path. Another flood of much greater severity swept the south side of the town on August 26. This flood brought down from the hills sand, gravel, and bowlders in large quantities, which in some cases covered the land so completely that it will cost more than the land is worth to clear it, and in addition cut large canals across some of the best fields. One farmer lost 8 acres in this way. Grain in the shock and some alfalfa hay that lay in the course of the flood were carried away. The damage amounted to about \$5,000.

On Sunday evening, August 24, what is locally known as the "annual August flood" visited Ephraim, Utah, and broke all previous records in the matter of damaging property. The writer, two days after the flood, saw the record that it left in the form of mud, gravel, bowlders, and débris. Many cellars in the residence district were filled with mud, and lawns were covered so deep as to destroy the grass and small plants. The great force of the flood was shown by the large number and size of the bowlders, one of which was estimated to contain 25 cubic feet.

At Levan, Utah, on the 29th of August, one of the heaviest rain storms known in years passed over the Levan Ridge. On the west side of the valley large streams of water swept down every canyon and low place in the valley, crossing the farms on the west bench and doing considerable damage.

On August 30 a very severe storm broke over Ogden, Utah, flooding cellars and otherwise damaging property.

12386—13—8

A house was struck by lightning, trees were split in twain, and for a time the city had the aspect of Venice. Street cars were stalled, and some were derailed by the glut of sand and mud washed down from the hills. The damage amounted to thousands of dollars.

A landslide occurred at Thisbe, Nev., on August 5, delaying the westbound Southern Pacific train several hours. It was caused by a heavy downpour of rain which dislodged hundreds of tons of earth and rock, including bowlders weighing over 10 tons each. The track was covered at intervals for a distance of more than 1,000 feet.

Another landslide occurred on the Nevada-California-Oregon Railroad and on the Highland ditch of the Reno Light & Power Co., both near Reno, on August 29.

A cloud-burst near Derby, Nev., caused 21 serious landslides on August 4. A storm struck the canyon with terrific force between the Truckee Dam and Derby, where the canal is cut out of the hillside. Not less than 21 slides went into the canal, several of them as much as 50 feet long, and filling the canal to a depth of 7 feet.

A cloud-burst occurred at Ely, Nev., on the 26th, causing the loss of one life and the destruction of much property. Two days later a second flood occurred at the same place. The water on both occasions ran a foot deep as a rule in the streets and in places 3 feet deep. The light and power plant was stopped in its operation, and the city's supply of water cut off, as the ditch supplying the water was filled with mud and débris.

TABLE 1.—Climatological data for August, 1913. District No. 10, Great Basin.

a, b, c, etc., indicate, respectively, 1, 2, 3, etc., days missing from the record.  
 \*\* Temperature extremes are from observed readings of the dry bulb; means are computed from observed readings.  
 † Also on other dates.  
 T. Precipitation is less than 0.01 inch rain or melted snow.
