12 List of Figures

- 13 S1 Number of points available for non-homogeneous samples of the ensemble
 14 mean, control and deterministic forecasts and the spread (solid lines) and
 15 the number of points for homogeneous samples (dashed line). 3
- 16 S2 Location errors for non-homogeneous (left) and homogeneous (right) sam-
 17 ples, (a) and (b) using IBTrACS verification, (c) and (d) using full resolu-
 18 tion analysis MSLP verification, (e) and (f) using LVL. 4
- 19 S3 Intensity errors for non-homogeneous (left) and homogeneous (right) sam-
 20 ples, (a) and (b) using IBTrACS winds verification, (c) and (d) using full
 21 resolution analysis winds verification, (e) and (f) using LVI. 5
- 22 S4 Intensity biases for non-homogeneous (left) and homogeneous (right) sam-
 23 ples, (a) and (b) using IBTrACS winds verification, (c) and (d) using full
 24 resolution analysis winds verification, (e) and (f) using LVI. 6
- 25 S5 Non-homogeneous (left) and homogeneous (right) statistics for LVL and
 26 LVI for 2008, (a) and (b) LVL, (c) and (d) LVI, (e) and (f) LVI biases. 7
- 27 S6 Separation times (hours) for the different forecast types for verification
 28 using IBTrACS (left column) and NWPa, MSLP (right column), (a) and
 29 (b) MSLP location errors and spread, (c) and (d) MSLP errors and spread,
 30 (e) and (f) 10m wind speed errors and spread. 8

31 S7 Separation times (hours) for the different forecast types for verification
32 using NWPa, LVL and LVI, (a) LVL errors and spread, (b) LVI errors and
33 spread.

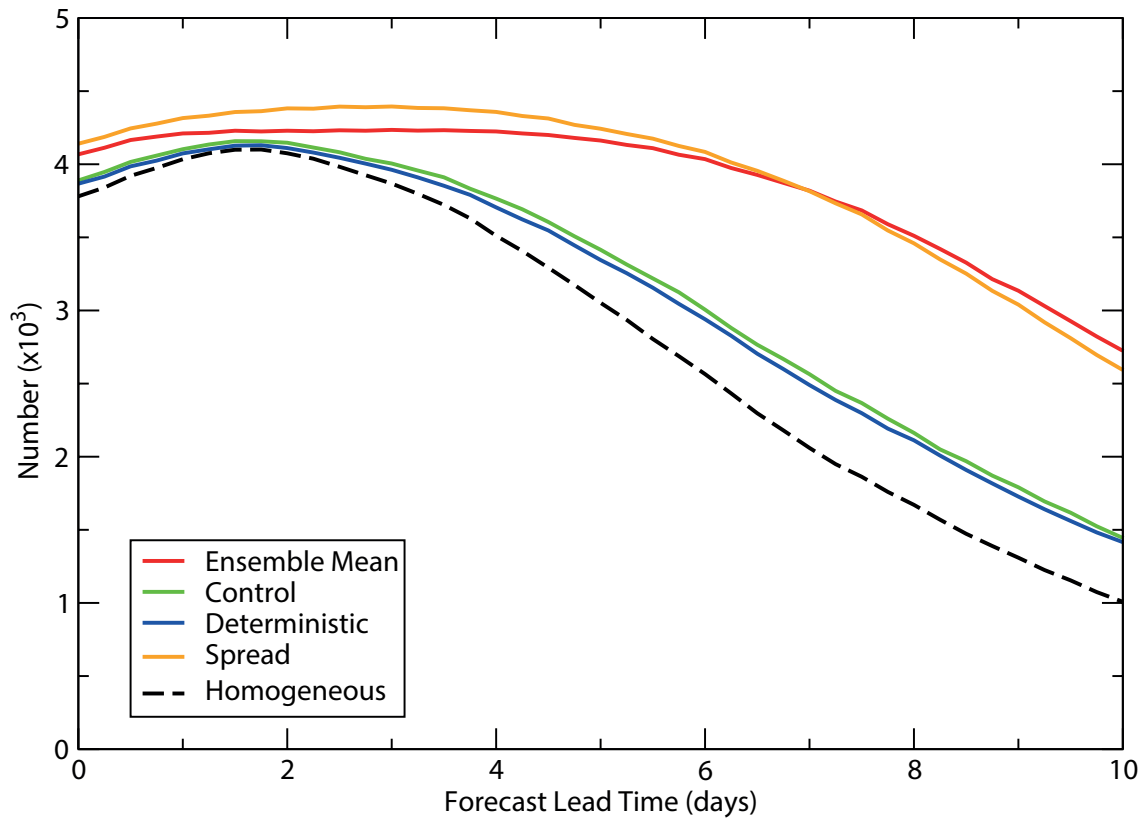

Fig. S1: Number of points available for non-homogeneous samples of the ensemble mean, control and deterministic forecasts and the spread (solid lines) and the number of points for homogeneous samples (dashed line).

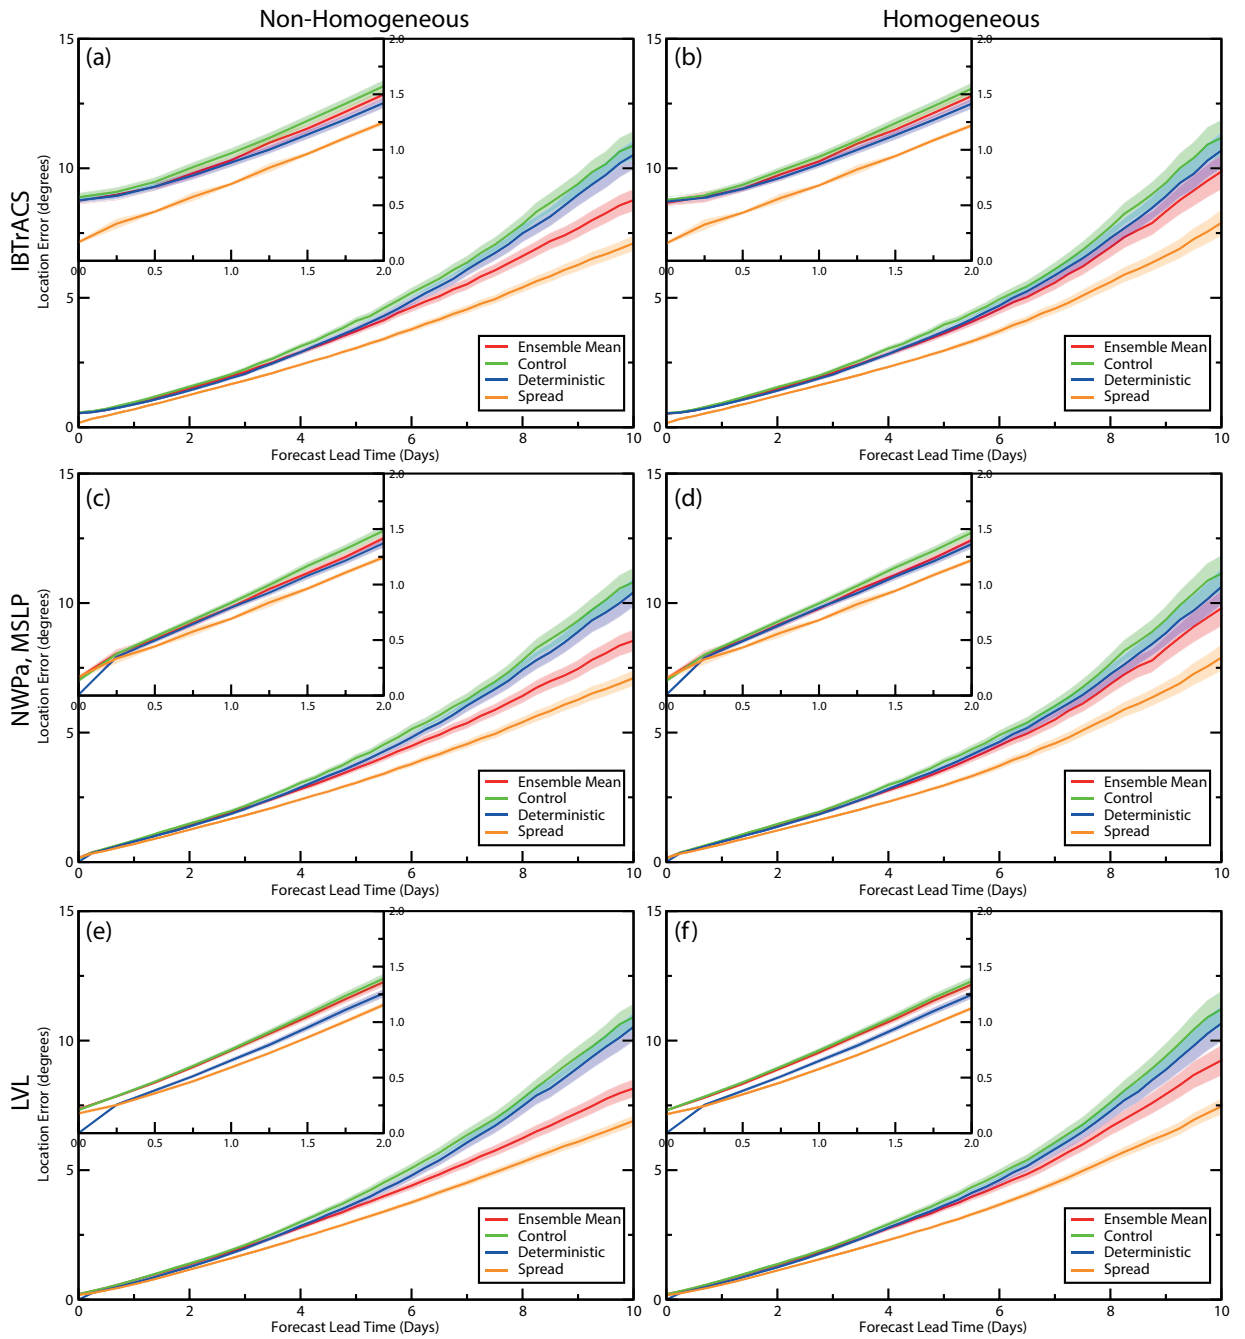

Fig. S2: Location errors for non-homogeneous (left) and homogeneous (right) samples, (a) and (b) using IBTrACS verification, (c) and (d) using full resolution analysis MSLP verification, (e) and (f) using LVL.

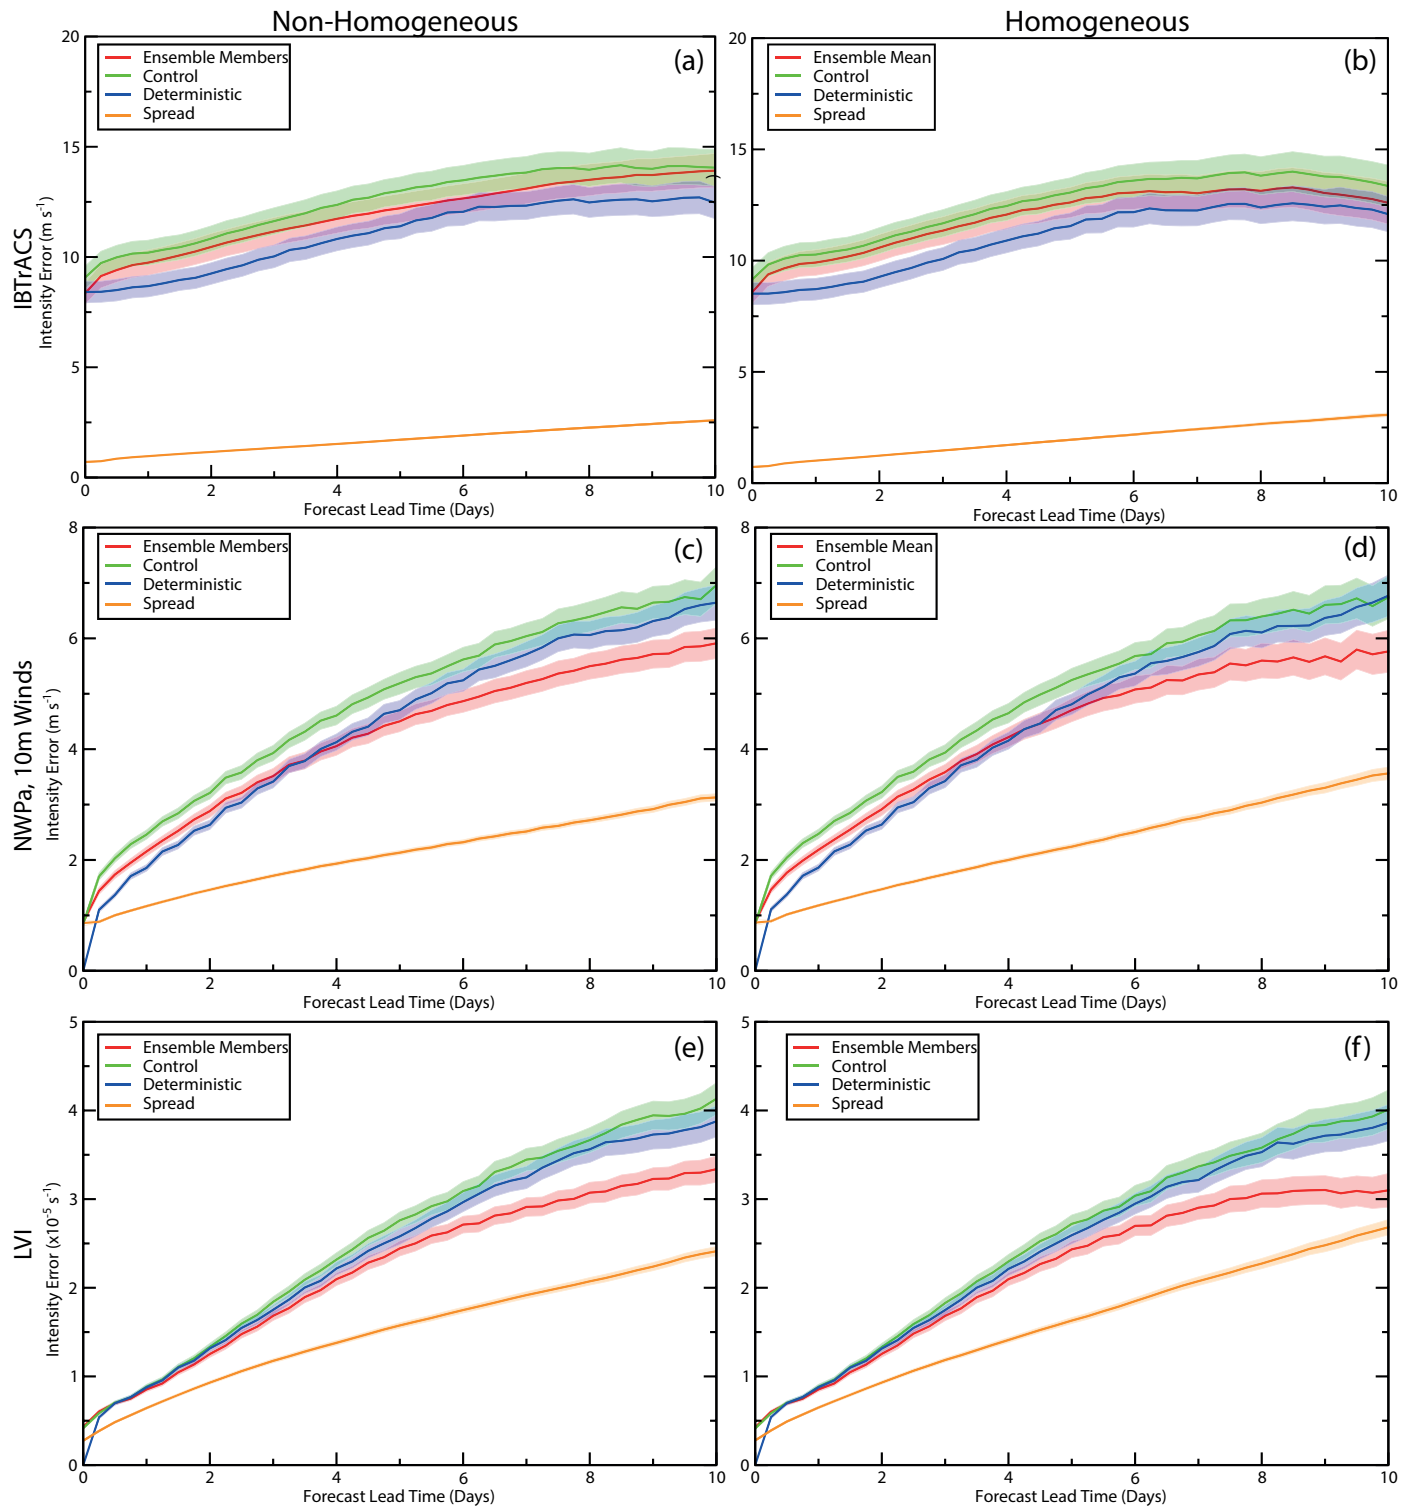

Fig. S3: Intensity errors for non-homogeneous (left) and homogeneous (right) samples, (a) and (b) using IBTrACS winds verification, (c) and (d) using full resolution analysis winds verification, (e) and (f) using LVI.

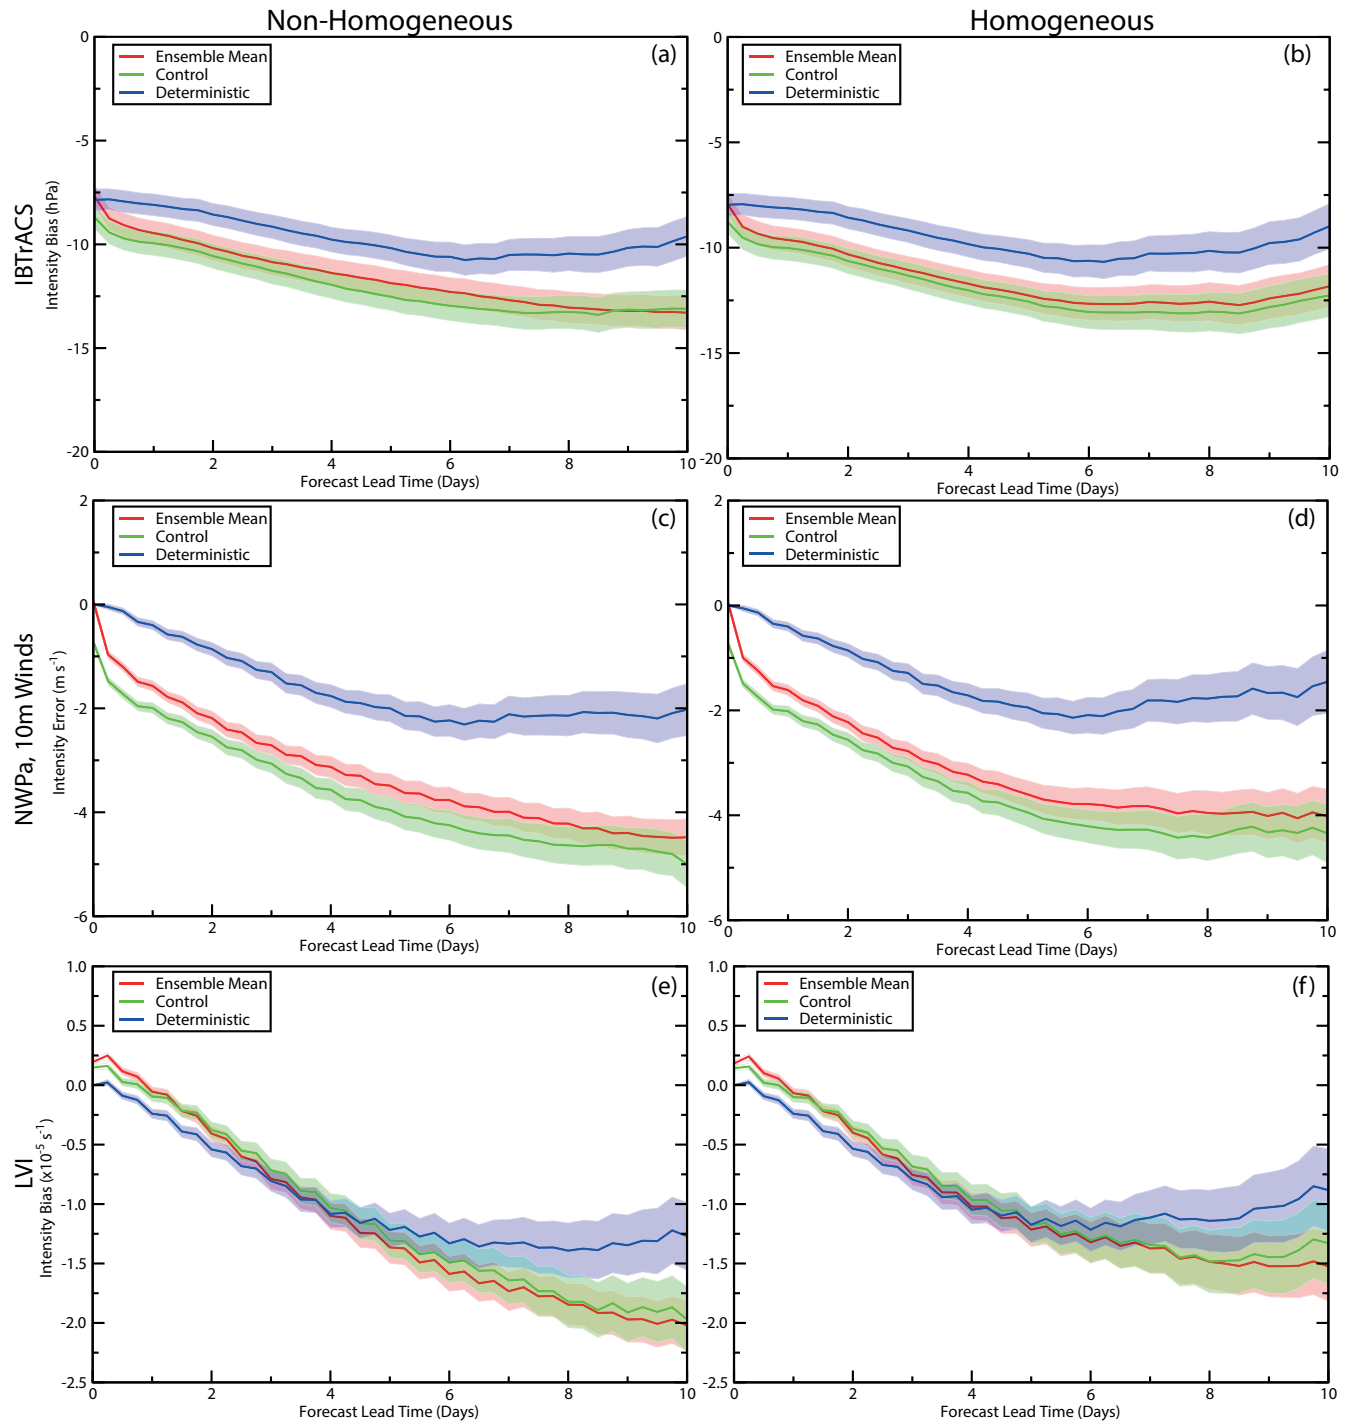

Fig. S4: Intensity biases for non-homogeneous (left) and homogeneous (right) samples, (a) and (b) using IBTrACS winds verification, (c) and (d) using full resolution analysis winds verification, (e) and (f) using LVI.

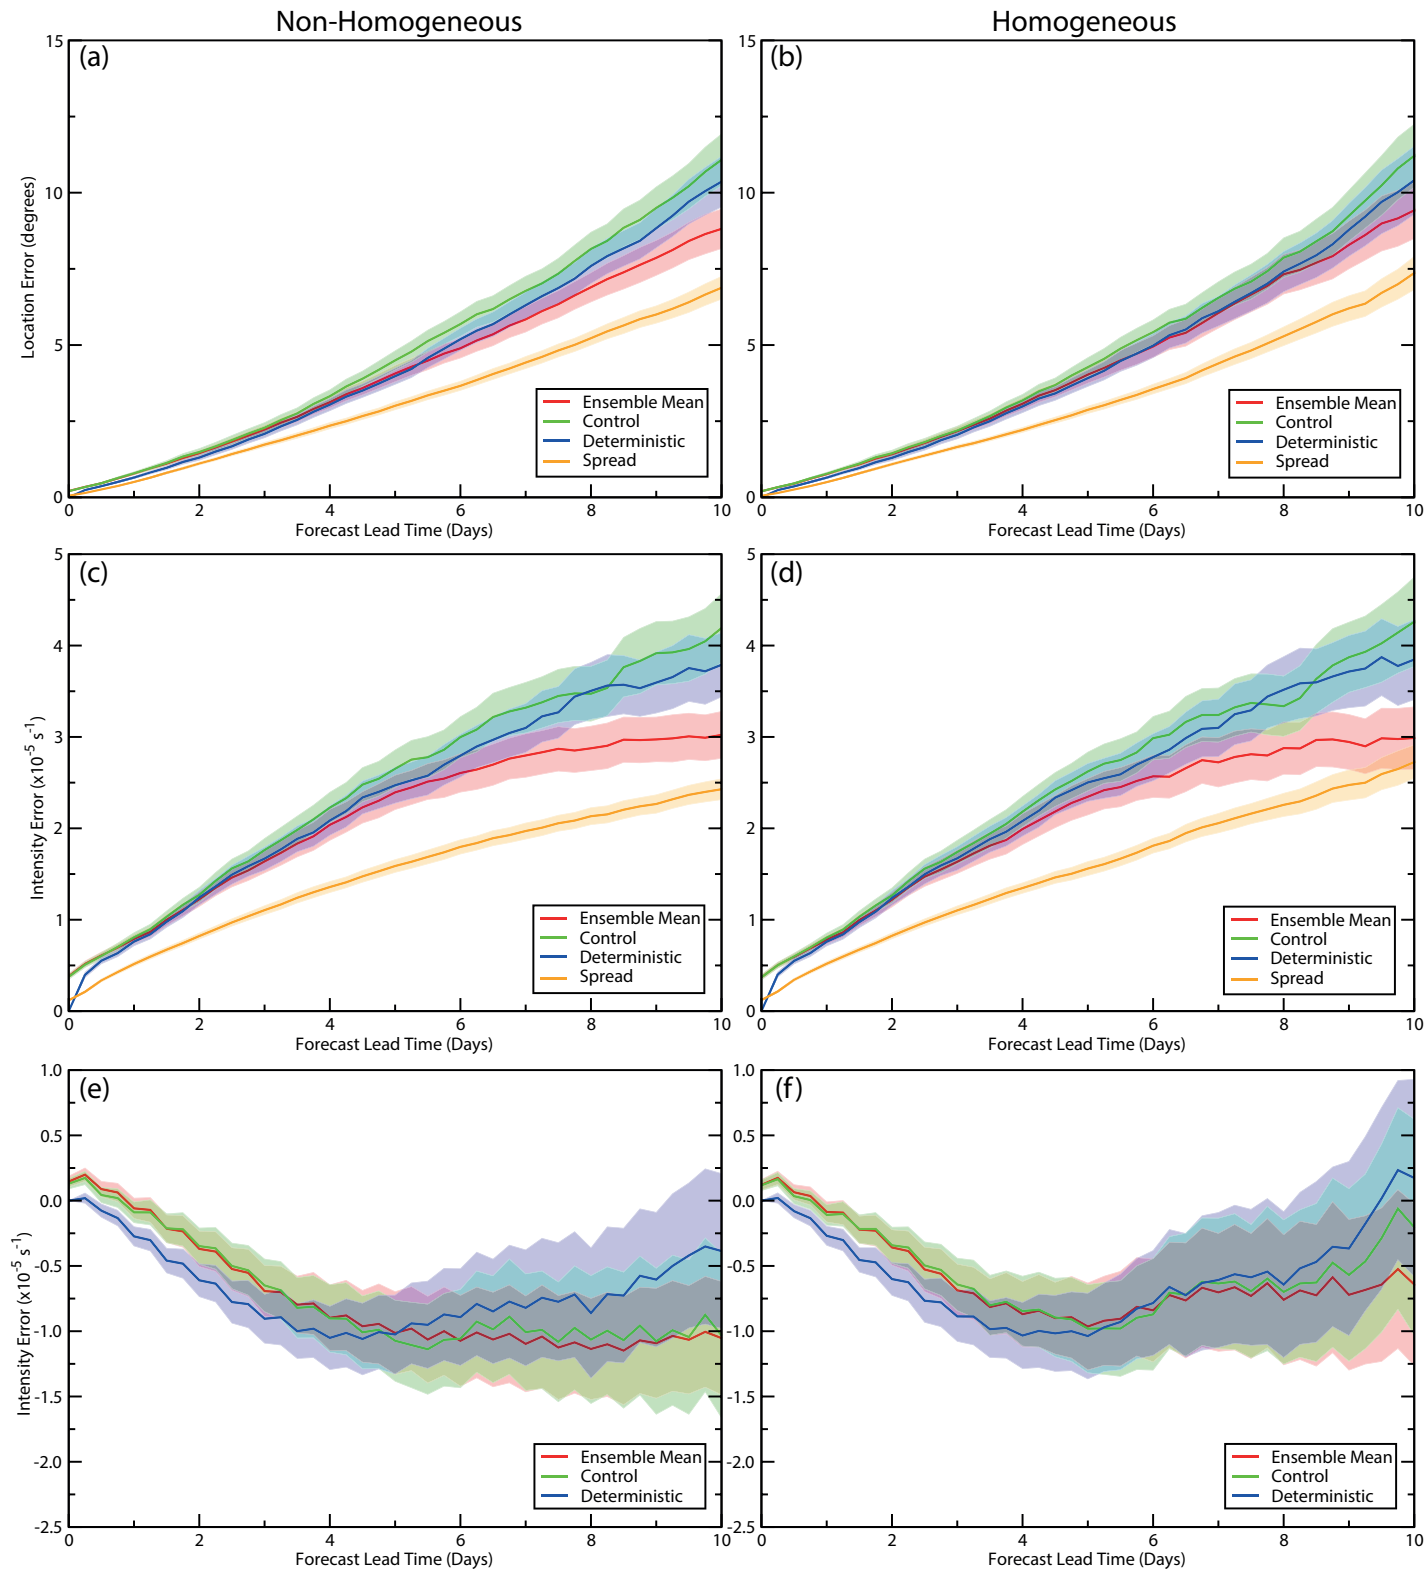

Fig. S5: Non-homogeneous (left) and homogeneous (right) statistics for LVL and LVI for 2008, (a) and (b) LVL, (c) and (d) LVI, (e) and (f) LVI biases.

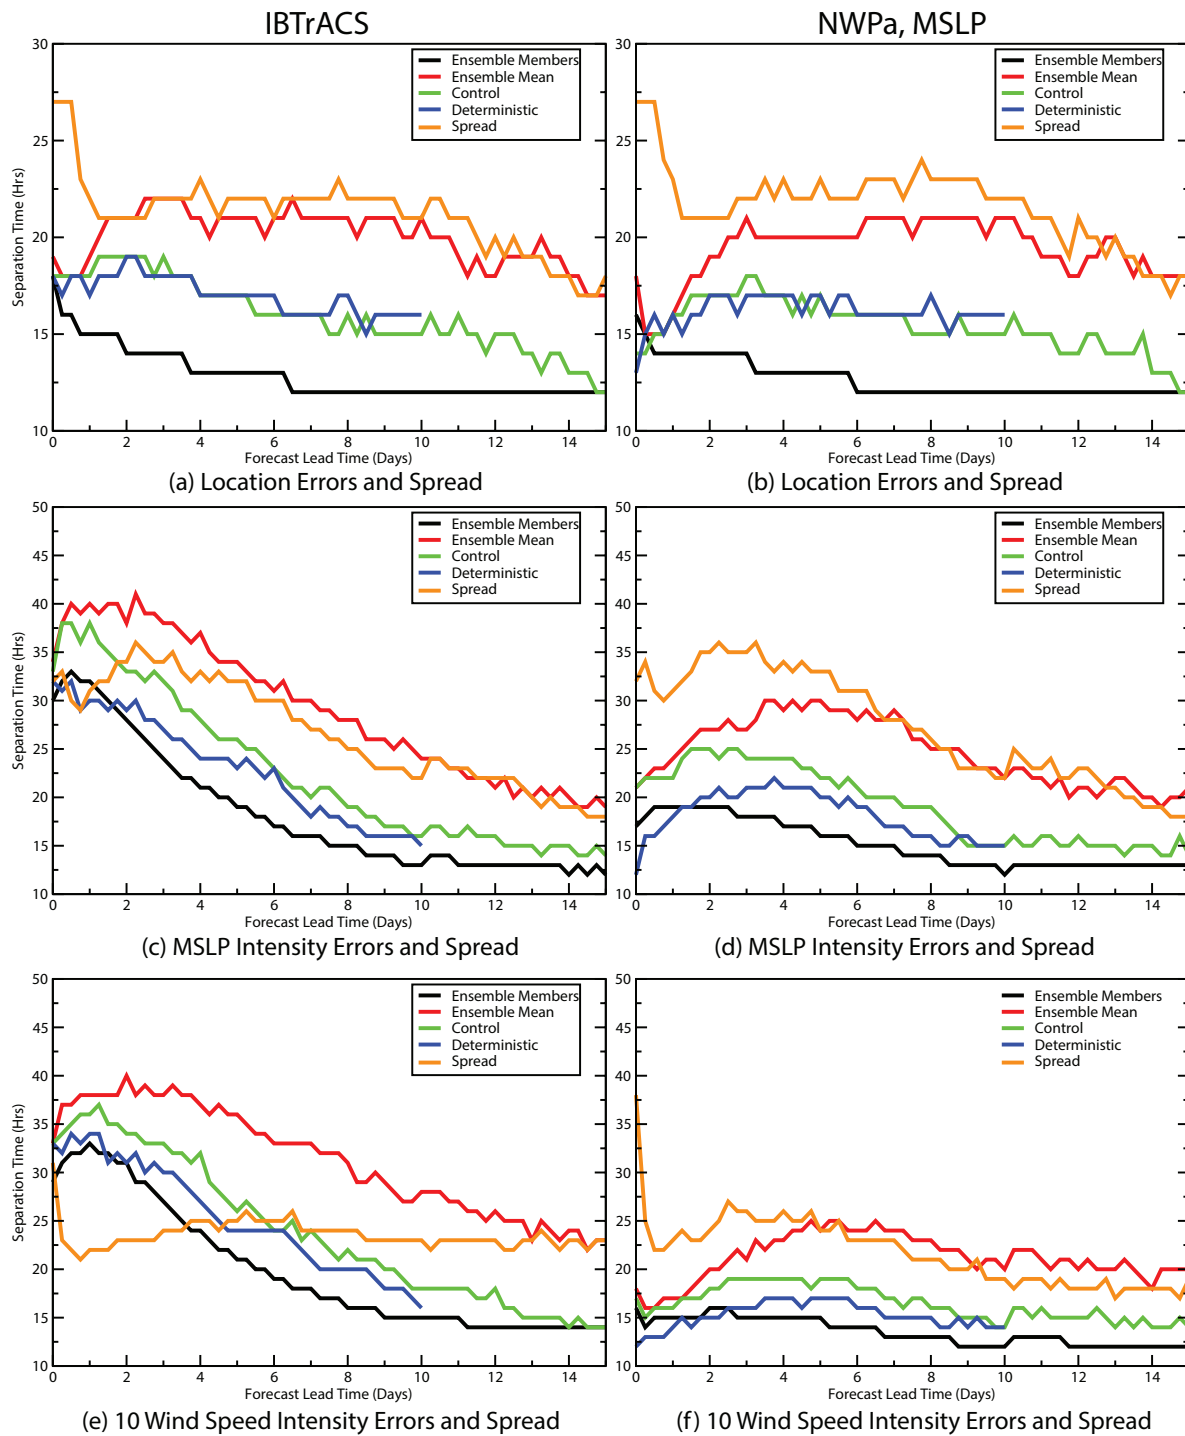

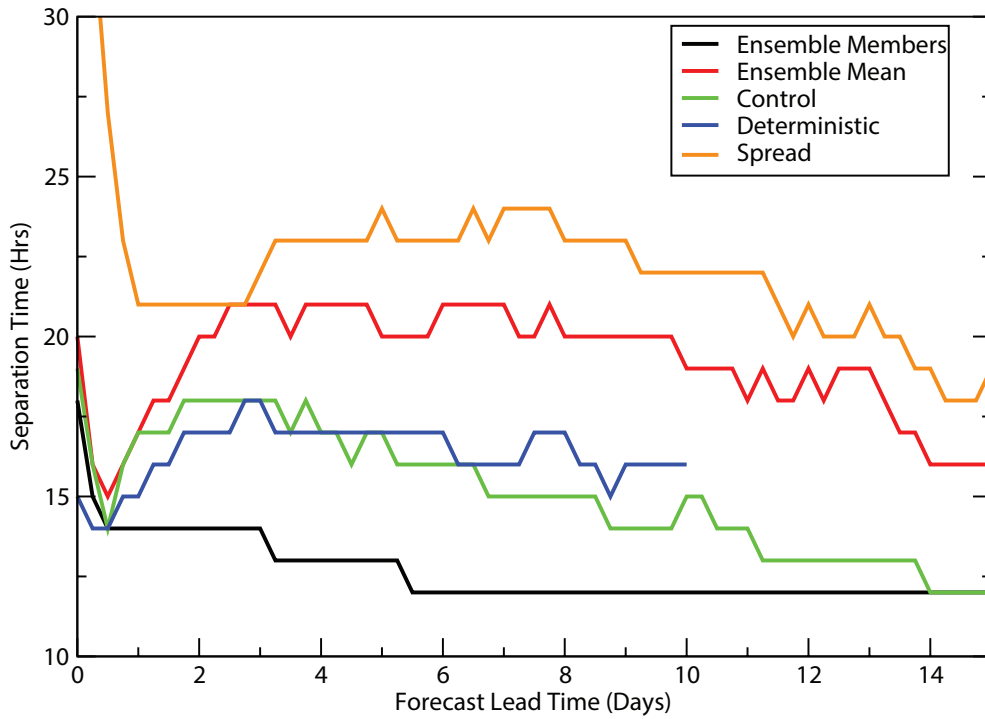

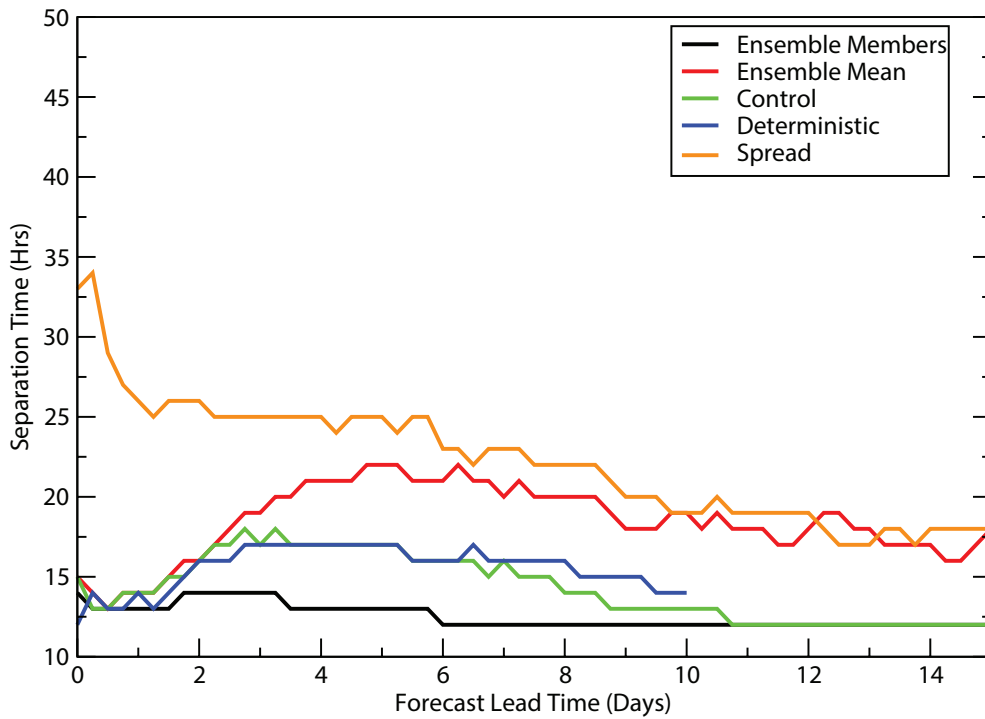

Fig. S6: Separation times (hours) for the different forecast types for verification using IBTrACS (left column) and NWPa, MSLP (right column), (a) and (b) MSLP location errors and spread, (c) and (d) MSLP errors and spread, (e) and (f) 10m wind speed errors and spread.

(a) LVL errors and spread

(b) LVI errors and spread

Fig. S7: Separation times (hours) for the different forecast types for verification using NWPa, LVL and LVI, (a) LVL errors and spread, (b) LVI errors and spread.
